Merknader	
-----------	--

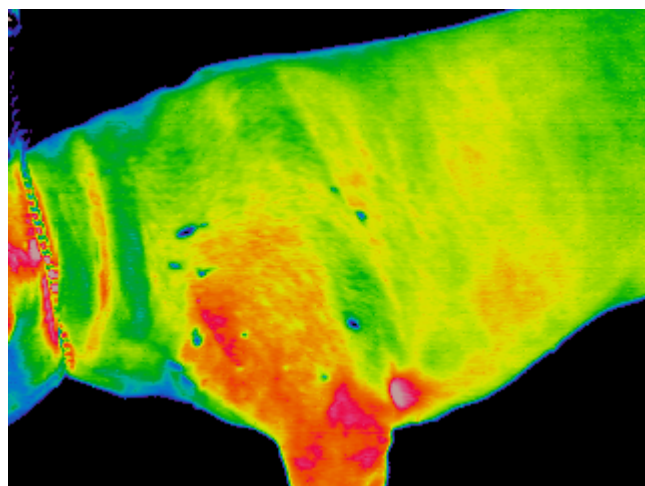

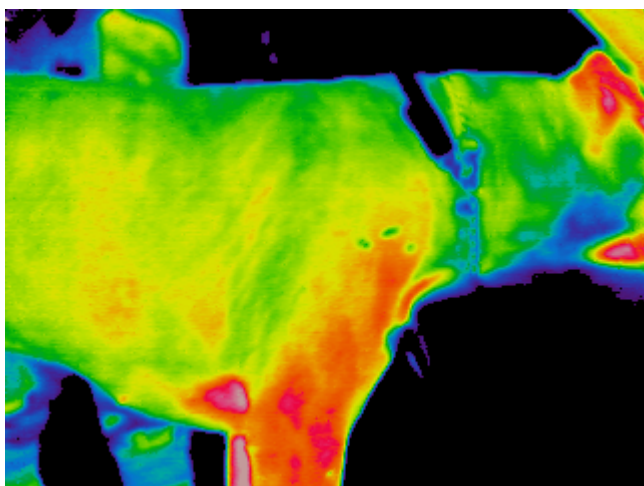

Noe kjølig i fallangerne foran, kan tyde på litt nedsatt sirkulasjon.

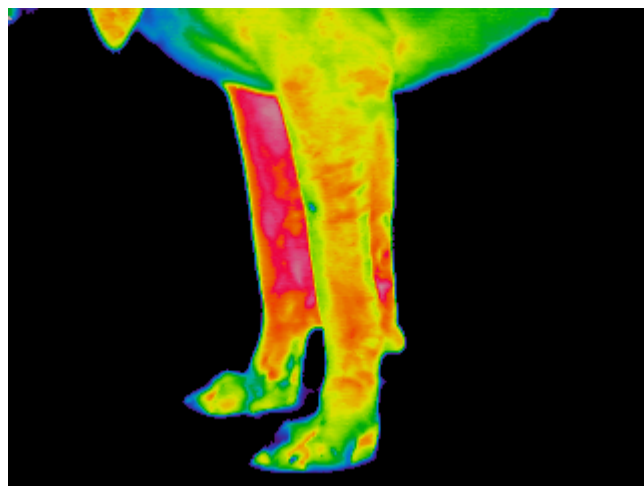

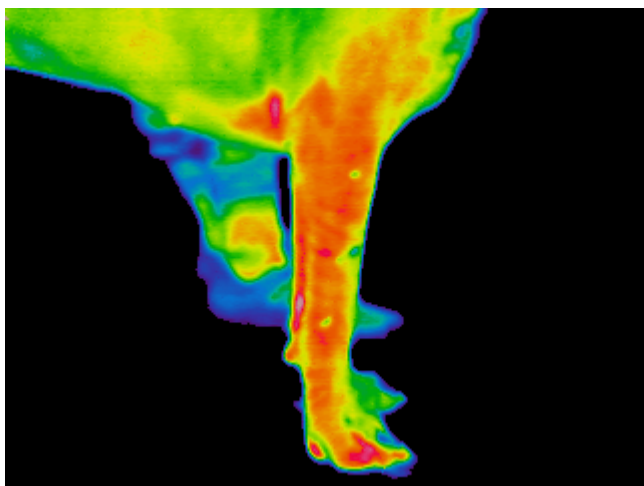

Jevn temperatur i pectoralis, men en forhøyet temperatur i biceps og pronator teres.

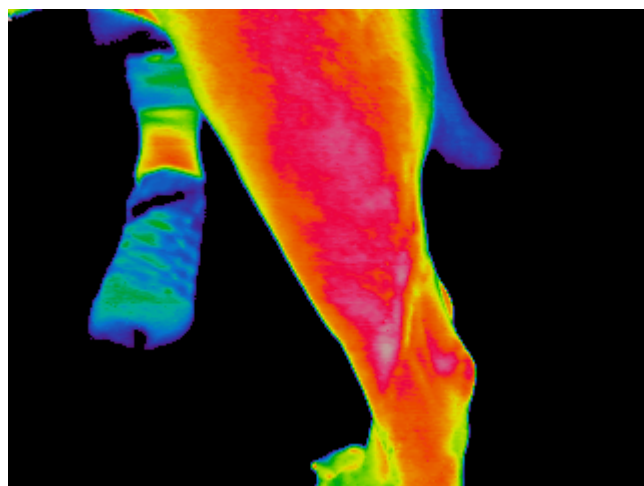

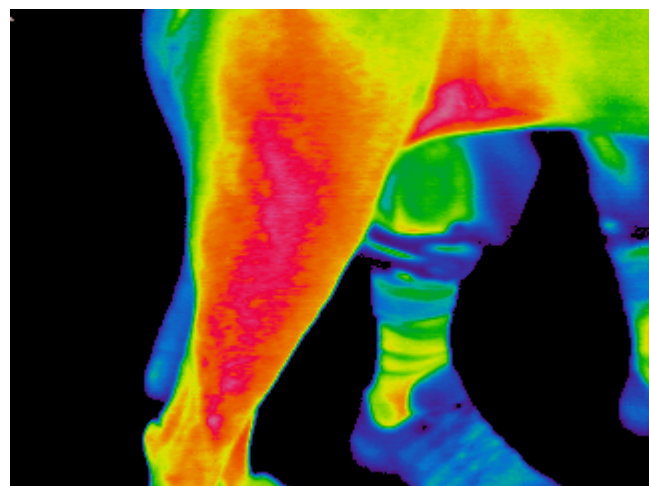

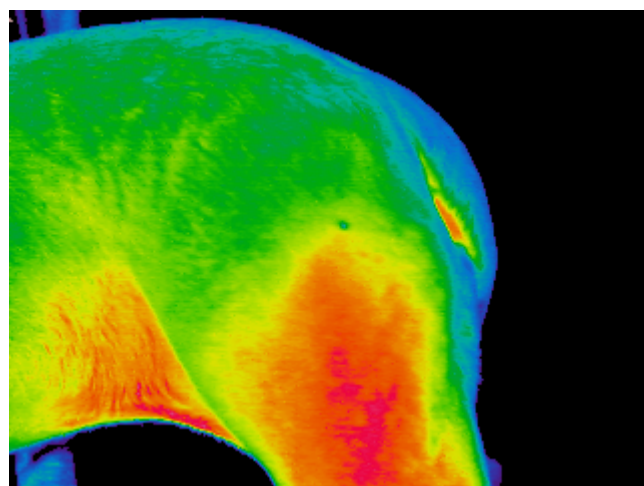

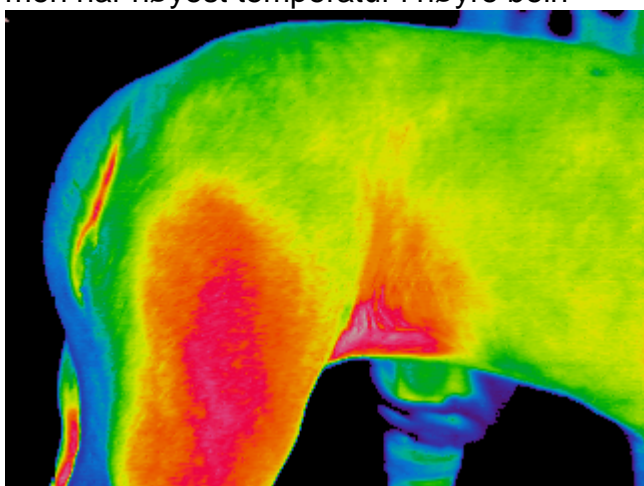

Hunden er betydelig varm høyre side i forhold til venstre

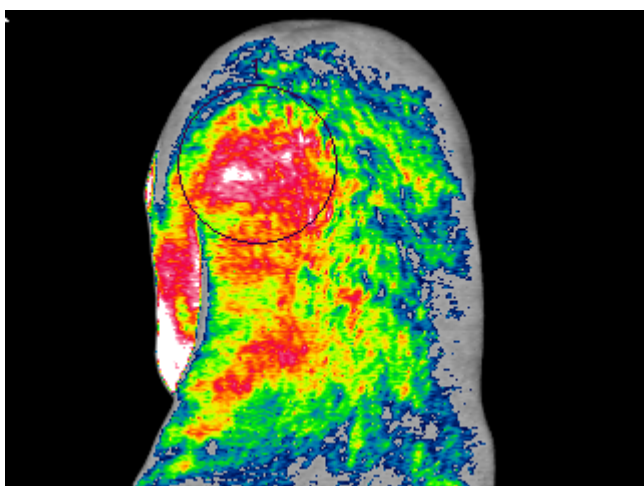

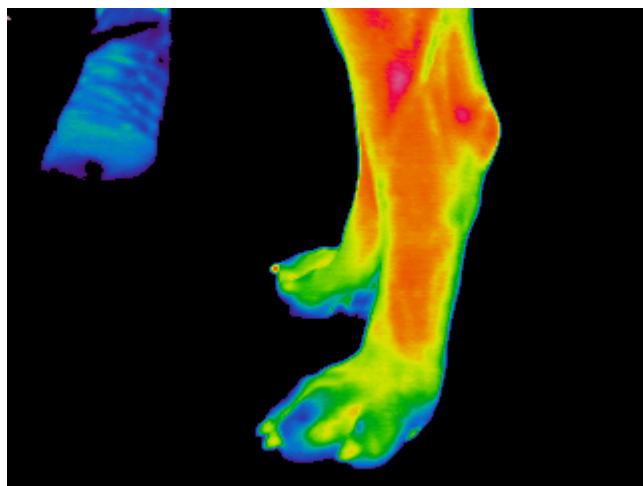

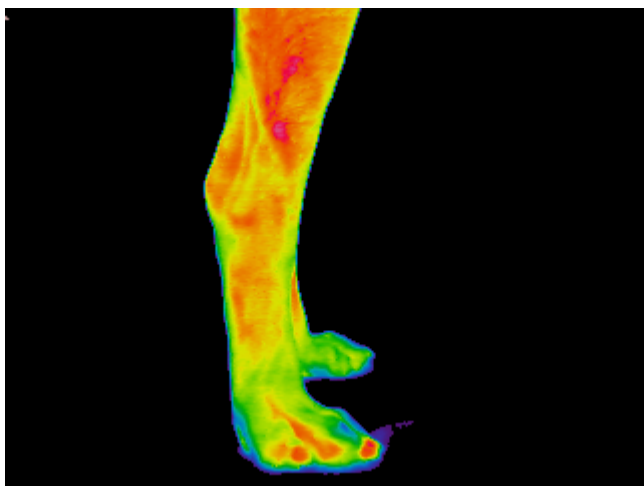

Hunden er varm i bogen begge sider

men har høyest temperatur i høyre bein

Hunden er tydelig varm i begge bakbein,men varmere i venstre

Her sitter ett problem som bør undersøkes av veterinær, sånn for sikkerhets skyld

Konklusjon: En forhøyet temperatur i lenderygg høyre side (bør sjekkes av veterinær)
Høyre fremme og venstre bak har også høyere temperatur, ser ut til å gå på diagonalen.
Hunden din vil nok ha stor nytte av å bli behandla for kompensatoriske spenninger.
Husk også å varm henne opp før tur og gå henne ned igjen når dere er ferdige.
Er det noe du lurer på ang bildene er det bare å ringe:)
